Subject: Third Quarter 2005 Groundwater Monitoring Report
Quik Stop Market No.35
816 McMinn Avenue, Santa Rosa, California
(RWQCB Case No. ITSR275)
(CCI Project No. 12032-2)

Dear Mr. Karvelot:

Compliance & Closure, Inc. (CCI) is pleased to present the Third Quarter 2005 Groundwater Monitoring Report for the sampling of the six on-site and six off-site groundwater monitoring wells at Quik Stop Market No. 35, located at 816 McMinn Avenue, Santa Rosa, Sonoma County, California (Figure 1). CCI completed the well sampling in accordance with the requirements of the North Coast Regional Water Quality Control Board (RWQCB). CCI hereby presents the groundwater measurements and well sampling data collected on August 3, 2005.

In June 2003, CCI installed six additional monitoring wells at on-site and off-site locations. Three of these wells (MW-1B, MW-2B and MW-3B) were installed to depths of approximately 55 feet, into the "B-Aquifer", to monitor groundwater conditions in that zone. The other three wells (MW-7, MW-8 and MW-9) were installed to depths of 25 feet, into the upper "A-Aquifer" to better define and monitor the upper shallow water zone. On August 3, 2005, CCI collected groundwater samples from the wells the same day depth-to-groundwater data were collected by Environmental Resolutions, Inc. (ERI), which is working at the Triple S Tire site. CCI has requested a copy of the Triple S groundwater data for use in generating the groundwater contour maps for the this report, however, CCI has not yet received any groundwater data as of the date of this report.

At the required by the RWQCB, the quarterly report will be uploaded to the State Geotracker data base. In addition, the laboratory report has been upload to the Geotracker data based under

confirmation number 7966143667.

Groundwater Sampling

Groundwater samples were collected from the twelve wells in accordance with CCI's Groundwater Sampling Protocol (Appendix A). The groundwater purged from the wells and equipment rinse water were placed in a properly labeled, Department of Transportation-approved drum and left at the site in a secured, fenced area, pending laboratory results. A summary of the groundwater purge data is presented in Table 1.

Laboratory Analysis

Entech Analytical Labs, Inc. (Entech), located in Santa Clara, California, a state-certified laboratory, analyzed the water samples for the presence of total petroleum hydrocarbons as gasoline (TPHg) using EPA Method 8015M, benzene, toluene, ethylbenzene, and total xylenes (BTEX), using EPA Method 8021B. The water samples were also analyzed for fuel oxygenates and 1, 2-Dichloroethane (1, 2-DCA) by GC/MS using EPA Method 8260B.

Summary of Groundwater Laboratory Results

As previously mentioned, the twelve monitoring wells were sampled on August 3, 2005. The six pre-existing wells (MW-1 through MW-6) and wells MW-7, MW-8, and MW-9 are screened in the upper water-bearing zone, designated the A-Aquifer. MW-1B, MW-2B and MW-3B were completed in the lower water bearing zone, designated the B-Aquifer. Analytical results are summarized in Table 2. Copies of the laboratory reports and chain of custody documents are attached in Appendix B. Analytical results for the A-Aquifer and B-Aquifer groundwater samples are plotted on Figure 2 and Figure 3, respectively.

During sampling of the wells, the groundwater surface was measured at 122.73 to 126.33 feet above mean sea level (msl) in the A-Aquifer wells and at 116.09 to 118.52 feet above msl in the B-Aquifer wells. The difference in elevation indicates a lack of vertical communication between the A- and B-Aquifers. Using the A-Aquifer wells, the general groundwater flow direction in that aquifer is toward the southwest, at an approximate gradient of 0.011 to 0.017 foot per foot (Figure 4). The groundwater flow direction in the B-aquifer is toward the west, at an approximate gradient of 0.03 foot per foot (Figure 5).

CCI continues to wait for comments and approval from the RWQCB regarding the proposed installation of a Kerfoot Technologies C-Sparge® System (System) to remediate the groundwater contamination at the site. If the System is approved, CCI will begin developing a Corrective Action Plan (CAP) for the subject site. Quik Stop will continue to monitor the water quality at the site. The next Quarterly Sampling Report is scheduled for November 2005. A copy

of this report should be forwarded to the following agency in a timely manner:

RWQCB
North Coast Region
5550 Skyline Blvd., Ste. A
Santa Rosa, California 95403
Attention: Mr. Bill Erdei

Limitations

The discussion presented in this report is based on the following:

1. The observations of the field personnel;
2. The results of the laboratory analyses performed by a state-certified laboratory;
3. Our understanding of the regulations of the State of California and Sonoma County.

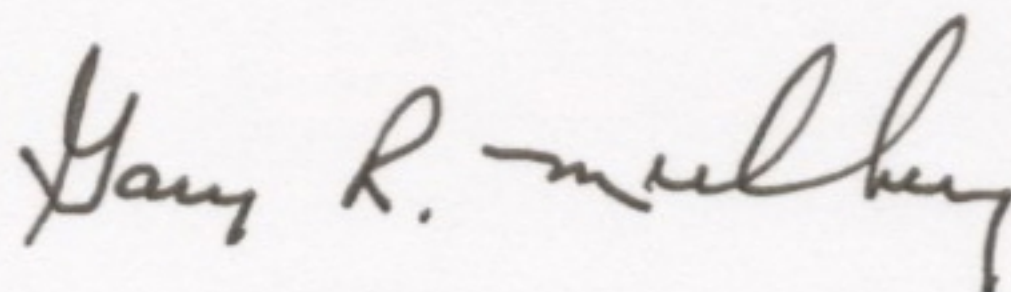

It is possible that variations in the soil or groundwater conditions could exist beyond the points explored in this investigation. Also, changes in groundwater conditions could occur at some time in the future due to variations in rainfall, temperature, regional water usage, or other factors.

The services performed by CCI have been conducted in a manner consistent with the level of care and skill ordinarily exercised by members of our profession currently practicing under similar conditions in the Santa Rosa area. No other warranty, express or implied, is made. Please note that contamination of soil and groundwater must be reported to the appropriate agencies in a timely manner.

CCI includes in this report chemical analytical data from a state-certified laboratory. CCI has been informed that the analyses are performed according to procedures suggested by the U.S. EPA and State of California. CCI is not responsible for laboratory errors in procedure or result reporting.

If you have any questions or require additional information, please call me at (925) 648-2008.

Sincerely,
Compliance & Closure, Inc.

Gary R. Mulkey, R.G. 5842

APPENDIX A

CCI's Groundwater Sampling Protocol

COMPLIANCE & CLOSURE, INC.

Latest Revision: January 2005

GROUNDWATER SAMPLING PROTOCOL

Sampling of groundwater is performed by Compliance & Closure, Inc. sampling technicians. Summarized field sampling procedures are as follows:

1. Measure depth to water in all wells prior to sampling (+- 0.01')
Calibrate field equipment. Proceed to first well with clean and decontaminated equipment..
2. Measurements of liquid surface(s) in the well, and total depth of monitoring well. Note presence of silt accumulation.
3. Field check for presence of floating product; measure apparent thickness.
4. Purge well with disposable bailer prior to collecting samples; purge volume (Minimum of 3 casing volumes) calculated prior to removal.
5. Monitor groundwater for temperature, pH, and specific conductance, note turbidity during purging. Allow temperature, pH and specific conductance to stabilize. Allow well to recover.
6. Collect samples using Environmental Protection Agency (EPA) approved sample collection devices, i.e., disposable bailers. Test parameters will include EPA 8260B for fuel oxygenates requested, EPA 8015M for TPHg and BTEX with EPA 8020.
7. Transfer samples into laboratory-supplied EPA-approved containers. Minimize aeration and avoid headspace in VOAs.
8. Label samples and log onto chain-of-custody form.
9. Store samples in a chilled ice chest for shipment to a state- certified analytical laboratory. Chain-of-custody to be remain with samples.
10. Decontaminate equipment (water level sounder) prior to sampling next well. Disposable bailers to be used and discarded after each use.
11. Drum purge water collected from the site wells will be labeled and stored on site.

Compliance & Closure, Inc.
Groundwater Sampling Protocol
Latest Revision: January 2005

Equipment Cleaning and Decontamination

All water samples are placed in precleaned laboratory-supplied bottles. Sample bottles and caps remain sealed until actual usage at the site. All equipment which comes in contact with the well or groundwater is thoroughly cleaned with hexane wipes then trisodium phosphate (TSP) solution and rinsed with deionized or distilled water before each use at the site. This cleaning procedure is followed between each well sampled. Wells are sampled in approximate order of increasing contamination. If a Teflon cord is used, the cord is cleaned. If a nylon or cotton cord is used, a new cord is used in each well. If equipment blanks are collected, they will be collected between monitoring wells to test decontamination procedures. The blanks are analyzed periodically to ensure proper cleaning procedures are used.

Water Level Measurements

Depth to groundwater is measured in each well using a sealed sampling tape or scaled electric sounder prior to purging or sampling. If the well is known or suspected of containing free-phase petroleum hydrocarbons, an optical interface probe is used to measure the hydrocarbon thickness and groundwater level. Measurements are collected and recorded to the nearest 0.01 foot. Each monitoring well's total depth will be measured; this will allow a relative judgment of well siltation to be made and need for redevelopment.

Bailer Sheen Check

If no measurable free-phase petroleum hydrocarbons are detected, a clear acrylic bailer is used to determine the presence of a sheen. Any observed film, as well as odor and color of the water is recorded.

Groundwater Sampling

Prior to groundwater sampling, each well is purged of "standing" groundwater. A disposable bailer is used to purge the well. The amount of purging is dependent on the well yield. In a high yield formation, samples will be collected when normal field measurement, including temperature, pH, and specific conductance stabilize, provided a minimum of three well-casing volumes of water have been removed. Field measurements will be taken after purging each well volume. Physical parameter measurements (temperature, pH, and specific

Compliance & Closure, Inc.
Groundwater Sampling Protocol
Latest Revision: January 2005

conductance) are closely monitored throughout the well purging process and are used as indicators for assessing sufficient purging. The purging parameters are measured to observe stabilization to a range of values typical for that aquifer and well. Stable field parameters are recognized as indicative of groundwater aquifer chemistry entering the well. Specific conductance (conductivity) meters are read to the nearest ± 10 umhos/cm and are checked daily. Temperature is read to the nearest 0.1 F. Calibration of physical parameter meters will follow manufacturer's specifications. pH will be calibrated daily using two fresh buffer solutions. Collected field data during purging activities will be entered on the Well Sampling Field Data Sheet.

In low yield formations, the well is purged such that the "standing" water is removed and the well is allowed to recharge. (Normal field measurements will be periodically recorded during the purging process). In situations where recovery to 80% of static water level is estimated, or observed to exceed a two hour duration, a sample will be collected when sufficient volume is available for a sample for each parameter. Attempts will be made so the well is not purged dry such that the recharge rate causes the formation water to cascade into the well.

In wells where free-phase hydrocarbons are detected, the free-phase portion will be bailed from the well and the estimated volume removed and recorded. A groundwater sample will be collected if bailing reduces the amount of free-phase hydrocarbons to the point where they are not present in the well. Well sampling will be conducted using one of the aforementioned methods depending on the formation yield. However, if free-phase hydrocarbons persist throughout bailing, then a groundwater sample will not be collected.

Volatile organic groundwater samples are collected so that air passage through the sample does not occur or is minimal (to prevent volatiles from being stripped from the samples). Sample bottles are filled by slowly running the sample down the side of the bottle until there is a positive convex meniscus over the neck of the bottle; the Teflon side of the septum (in cap) is positioned against the meniscus, and the cap screwed on tightly; the sample is inverted and the bottle lightly tapped. The absence of an air bubble indicates a successful seal; if a bubble is evident, the cap is removed, more sample is added, and the bottle is resealed. If this occurs more than once in a given sample, a new sample will be collected.

Chain-of-Custody

Groundwater sample containers are labeled with a unique sample number, location, and date of collection. All samples are logged into a chain-of custody form and placed in a chilled ice chest for shipment to a laboratory certified by the State of California Department of Health Services.

Compliance & Closure, Inc.
Groundwater Sampling Protocol
Latest Revision: January 2005

Sample Storage

Groundwater samples collected in the field are stored in an ice chest cooled to 4 C while in transit to the office or analytical laboratory. Samples are stored in a refrigerator overnight and during weekends and holidays. The refrigerator is set to 4 C and is locked with access controlled by a designated sample custodian.

Quality Assurance/Quality Control Objectives

The sampling and analysis procedures employed by Compliance & Closure, Inc. for groundwater sampling and monitoring follow quality assurance/quality control (QA/QC) guidelines. Quality assurance objectives have been established to develop and implement procedures for obtaining and evaluating water quality and field data in an accurate, precise, and complete manner. In this way, sampling procedures and field measurements provide information that is comparable and representative of actual field conditions. Quality control (QC) is maintained by site-specific field protocols and requiring the analytical laboratory to perform internal and external QC checks. The goal is to provide data that are accurate, precise, complete, comparable, and representative. The definitions as developed by overseeing federal, state, and local agency guidance documents for accuracy, precision, completeness, comparability, and representativeness are:

- o **Accuracy** - the degree of agreement of a measurement with an accepted reference or true value.
- o **Precision** - a measure of agreement among individual measurements under similar conditions. Usually expressed in terms of the standard deviation.
- o **Completeness** - the amount of valid data obtained from a measurement system compared to the amount that was expected to meet the project data goals.
- o **Comparability** - express the confidence with which one data set can be compared to another.
- o **Representativeness** - a sample or group of samples that reflect the characteristics of the media at the sampling point. It also includes how well the sampling point represents the actual parameter variations which are under study.

Compliance & Closure, Inc.
Groundwater Sampling Protocol
Latest Revision: January 2005

Laboratory and field handling procedures of samples are monitored by including QC samples for analysis with every submitted sample lot from a project site. QC samples may include any combination of the following:

- o **Trip Blanks:** One Trip Blank will be collected and analyzed for purgeable organic compounds only; QC samples are collected in 40 milliliter (ml) sample vials filled in the analytical laboratory with organic-free water. Trip blanks are sent to the project site, and travel with project site samples. Trip blanks are **not** opened, and are returned from a project site with the project site samples for analysis.
- o **Duplicates:** Duplicated samples are collected "second samples" from a selected well at the project site. They are collected as either split samples or second-run samples collected from the same well. The duplicate sample will be analyzed using EPA Test Method 8260.
- o **Equipment Blank:** Periodic QC samples collected from field equipment rinseate to verify decontamination procedures (if applicable). Equipment rinsate blanks will be collected between sampling of wells.

The number and types of QC samples are determined and analyzed on a project-specific basis.
